

Sales CRM & Lead Management System

A simple web-based Customer Relationship Management (CRM) system built with **Django** to help small businesses manage customers, leads, sales opportunities, follow-ups, and customer interactions from a centralized platform.

Project Overview

The **Sales CRM & Lead Management System** is designed to provide businesses with a centralized and easy-to-use platform for managing their customer relationships and sales activities.

The system allows users to track leads from their initial entry through qualification and conversion into customers. It also provides tools for managing sales opportunities, recording customer interactions, and scheduling follow-up tasks.

The primary goal of the system is to replace scattered customer information and manual tracking methods with a structured digital CRM solution.

Business Problem

Small businesses and sales teams often manage customer and sales information using multiple disconnected tools such as:

- Excel or Google Sheets
- Notebooks
- Emails
- Messaging applications
- Separate documents

This creates several operational problems.

1. Scattered Customer Information

Customer information such as names, phone numbers, email addresses, companies, and notes may be stored in different locations.

This makes it difficult to find and maintain accurate customer information.

2. Missed Follow-Ups

Sales representatives may forget to follow up with leads or existing customers because follow-up activities are tracked manually.

This can result in lost sales opportunities.

3. Difficult Lead Tracking

Without a centralized system, it is difficult to determine the current status of a lead.

For example:

```
New → Contacted → Qualified → Converted
                        ↓
                      Lost
```

4. Lack of Sales Visibility

Managers may not have a simple way to understand:

- How many leads are currently active
- How many leads have been converted
- How many sales opportunities are open
- Which deals have been won or lost
- Which follow-ups are pending

5. Lack of Interaction History

Customer conversations, calls, meetings, and notes can become difficult to track when they are stored across different applications.

Proposed Solution

The CRM provides a centralized system for managing the complete basic sales lifecycle.

Users can:

- Store customer information
- Create and manage leads
- Track lead status
- Convert qualified leads into customers
- Manage sales opportunities
- Record customer interactions
- Create follow-up tasks
- Search and filter records
- Monitor sales activity through a dashboard

The system provides a single source of truth for customer and sales information.

Business Requirements Specification

1. User Authentication

The system shall provide secure user authentication.

Requirements

- User login
- User logout
- Password-based authentication
- Session management
- Authentication-protected CRM pages

Django's built-in authentication framework will be used for user management.

2. Dashboard

The system shall provide a dashboard that gives users an overview of CRM activities.

Dashboard Information

- Total customers
- Total leads
- Open opportunities
- Won opportunities

- Recent leads
- Upcoming follow-ups
- Recent activities
- Sales pipeline summary

Example:

Customers	Leads	Open Deals	Won Deals
120	35	18	42

3. Customer Management

The system shall allow users to manage customer records.

Customer Information

- Customer name
- Company
- Email
- Phone
- Address
- City
- Status
- Notes
- Created date
- Updated date

Operations

Users shall be able to:

- Add customers
 - View customers
 - Edit customers
 - Delete customers
 - Search customers
 - Filter customers
-

4. Lead Management

The system shall allow users to manage potential customers.

Lead Information

- Lead name
- Company
- Email
- Phone
- Lead source
- Lead status
- Assigned user
- Notes
- Created date
- Updated date

Lead Sources

The system may support sources such as:

- Website
- Referral
- Social Media
- Email
- Advertisement
- Other

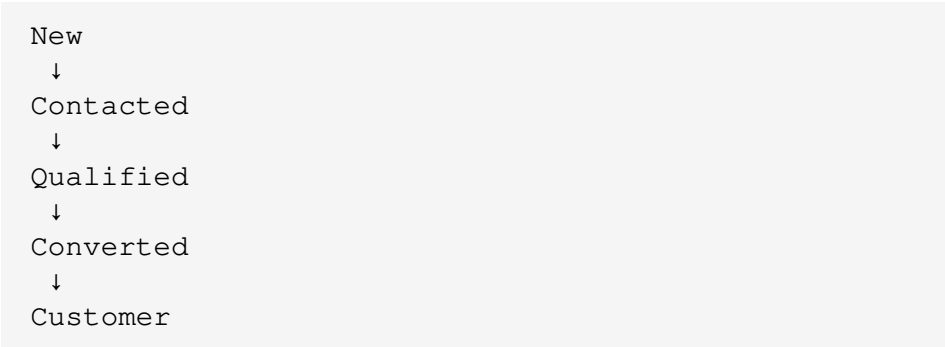

Lead Status

New
Contacted
Qualified
Converted
Lost

5. Lead Conversion

The system shall allow users to convert a qualified lead into a customer.

Conversion Flow

When a lead is converted, the system should create or associate the corresponding customer record.

6. Sales Opportunity Management

The system shall allow users to manage potential sales deals.

Opportunity Information

- Opportunity title
- Customer
- Deal amount
- Sales stage
- Probability
- Expected closing date
- Notes
- Created date
- Updated date

Opportunity Stages

Prospecting
Qualified
Proposal
Negotiation
Won
Lost

Example:

Opportunity: Website Development
Customer: ABC Technologies
Amount: ₹80,000
Stage: Proposal
Probability: 60%
Expected Close Date: 15 September 2026

7. Follow-Up and Task Management

The system shall allow users to create and manage customer follow-up tasks.

Task Information

- Task title
- Customer
- Lead
- Due date
- Priority
- Status
- Description
- Created by

Priority

Low
Medium
High

Status

Pending
Completed

Example:

Task: Follow up with ABC Technologies
Due Date: 5 September 2026
Priority: High
Status: Pending

8. Customer Activity Management

The system shall allow users to record interactions with leads and customers.

Activity Types

- Call
- Email
- Meeting
- Note
- Other

Activity Information

- Customer
- Lead
- Activity type
- Subject
- Description
- Activity date
- Created by

Example:

05 September 2026

Type: Call

Subject: Project Requirements

Discussed website development requirements
with the customer.

This provides a historical record of customer interactions.

9. Search and Filtering

The system shall provide basic search and filtering functionality.

Customer Search

Users can search customers by:

- Name
- Company
- Email
- Phone

Lead Filtering

Users can filter leads based on:

- Status
- Source
- Assigned user

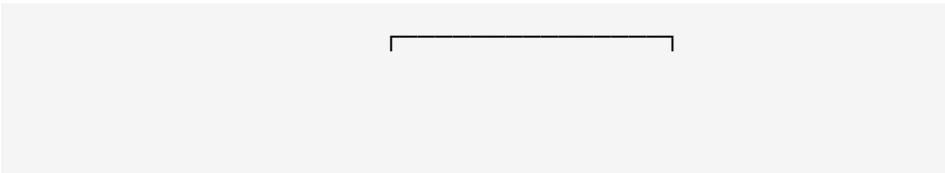

Opportunity Filtering

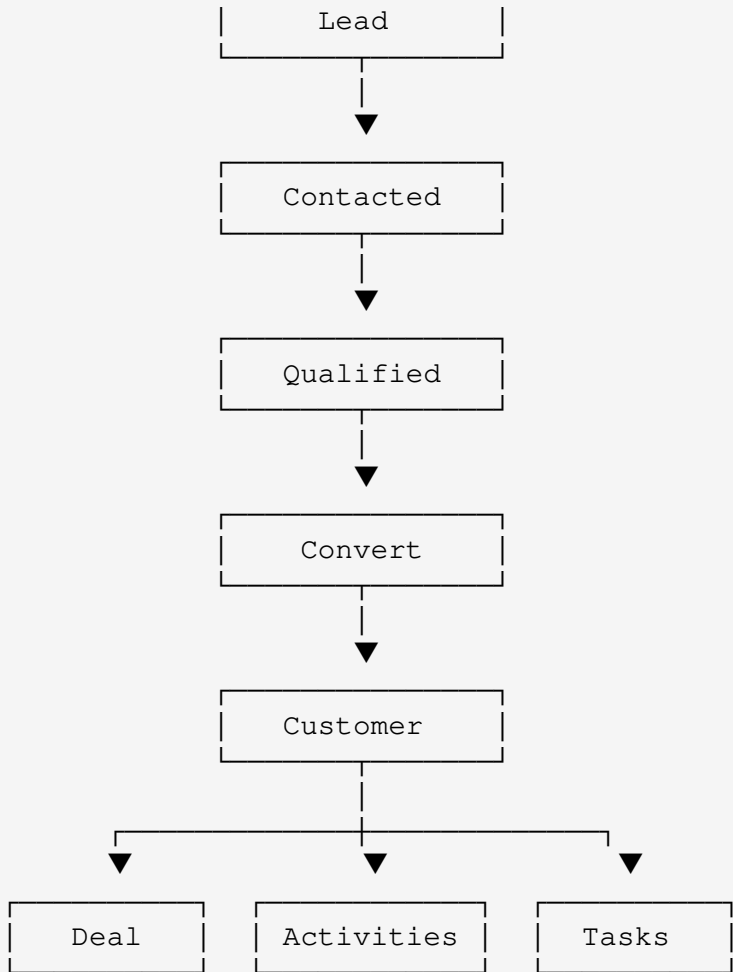

Users can filter opportunities based on:

- Sales stage
- Customer
- Status

Basic Business Workflow

The CRM should support the following basic business workflow:

❖ Core Features

Feature	Description
Authentication	Secure user login and logout

Dashboard	Overview of CRM and sales activities
Customer Management	Create, view, update, and delete customers
Lead Management	Manage potential customers
Lead Tracking	Track leads through different stages
Lead Conversion	Convert qualified leads into customers
Opportunity Management	Track potential sales deals
Follow-Up Tasks	Manage customer and lead follow-ups
Activity History	Record calls, emails, meetings, and notes
Search	Search customers and leads
Filtering	Filter records based on status and other attributes
Django Admin	Administrative management of CRM data

Technology Stack

Backend

- Python
- Django
- Django ORM
- Django Authentication

Frontend

- **HTML5**
- **CSS3**
- **Bootstrap**
- **JavaScript**

Database

- **SQLite** for development
- **PostgreSQL** can be used for production

Deployment

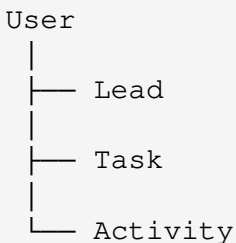

The application can be deployed using:

- Gunicorn
- Nginx
- AWS EC2

Core Data Entities

The application consists of the following primary entities:

|
└─ Customer

Customer

|
├─ Opportunity
├─ Activity
└─ Task

Main Entities

- User
- Customer
- Lead
- Opportunity
- Task
- Activity

Security Requirements

The application should follow Django's standard security practices.

These include:

- Authentication-protected pages
 - CSRF protection
 - Password hashing
 - Form validation
 - Server-side validation
 - Authentication-based access control
 - Secure session management
-

Future Enhancements

The following features can be added in future versions:

- Role-based access control
 - REST API using Django REST Framework
 - Email integration
 - Automated email notifications
 - WhatsApp integration
 - Advanced sales analytics
 - CSV import/export
 - Calendar integration
 - Sales forecasting
 - Customer segmentation
 - AI-powered lead analysis
 - Automated follow-up reminders
-

Project Scope

This project focuses on providing a **basic but functional CRM solution** for small businesses and sales teams.

The MVP focuses on the core CRM lifecycle:

```
Lead
↓
Qualification
↓
Conversion
↓
Customer
↓
Opportunity
```

↓

Follow-Up

↓

Interaction History

The system is designed to be simple, maintainable, and extendable while demonstrating the core capabilities of the Django framework.
